Delaunay Graph Spanner Notes

Simon Pratt

May 7, 2013

In these notes, we discuss the major results with respect to the Delaunay Graph as a spanner.

Delaunay Graph

P is a set of points in the plane, $DG(S)$ is a graph whose vertex set is P where u and v are connected by an edge only if the voronoi regions for u and v share an edge.

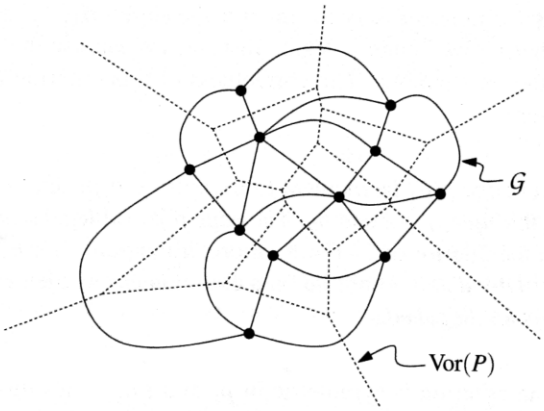

Figure 1: The Delaunay graph on P, including the boundaries of the Voronoi regions.

Dobkin's Results

The Delaunay triangulation of a set of points in the plane is a spanner with spanning ratio $c \leq ((1+\sqrt{5})/2)\pi \approx 5.08$. This was proven in the paper "Delaunay Graphs Are Almost as Good as Complete Graphs" by Dobkin, Friedman, and Supowit [1] [2].

Introduction

We consider the path between two arbitray points $a, b \in P$. Let the line connecting a, b be the *direct line*. We construct *the direct DT path* by walking along the direct line, each time a new face of the Voronoi diagram is reache we add the corresponding edge in the Delaunay

Graph.

One-Sided Path: The Easy Case

If all edges along the direct DT path between points $a, b \in P$ are either all above or all below the direct line, we say that this is a one-sided path.

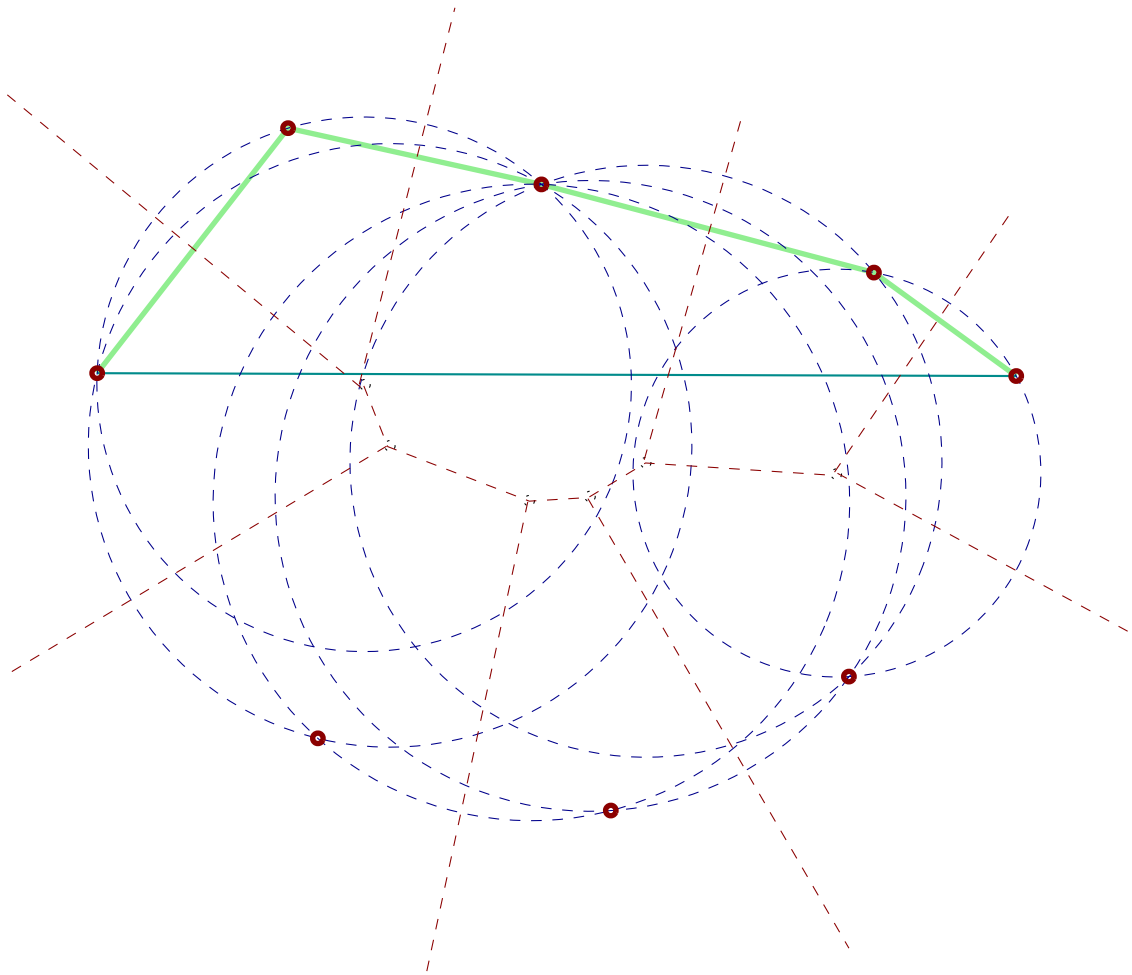

Figure 2: The cyan line shows the direct path, the green line shows the direct DT path, the dashed red lines show the boundaries of the Voronoi regions, and the circumcircles (also dashed) are blue.

Lemma 1. *Points along a direct DT path are monotonic in x.*

Lemma 2. *All points along the direct DT path from a to b are contained within or on the boundary of the circle with a and b diametrically opposed.*

Lemma 3. *The boundary of a connected union of circles has boundary at most $\pi \cdot (x_r - x_l)$ where x_r and x_l are the extreme x coordinates of any of the circles.*

From these lemmas, it follows that the one-sided path is at most $\pi/2$ times as long as the euclidean distance between the endpoints.

The Harder Case

The direct DT path may cross the direct line $\Omega(n)$ times, which can yield a much longer path.

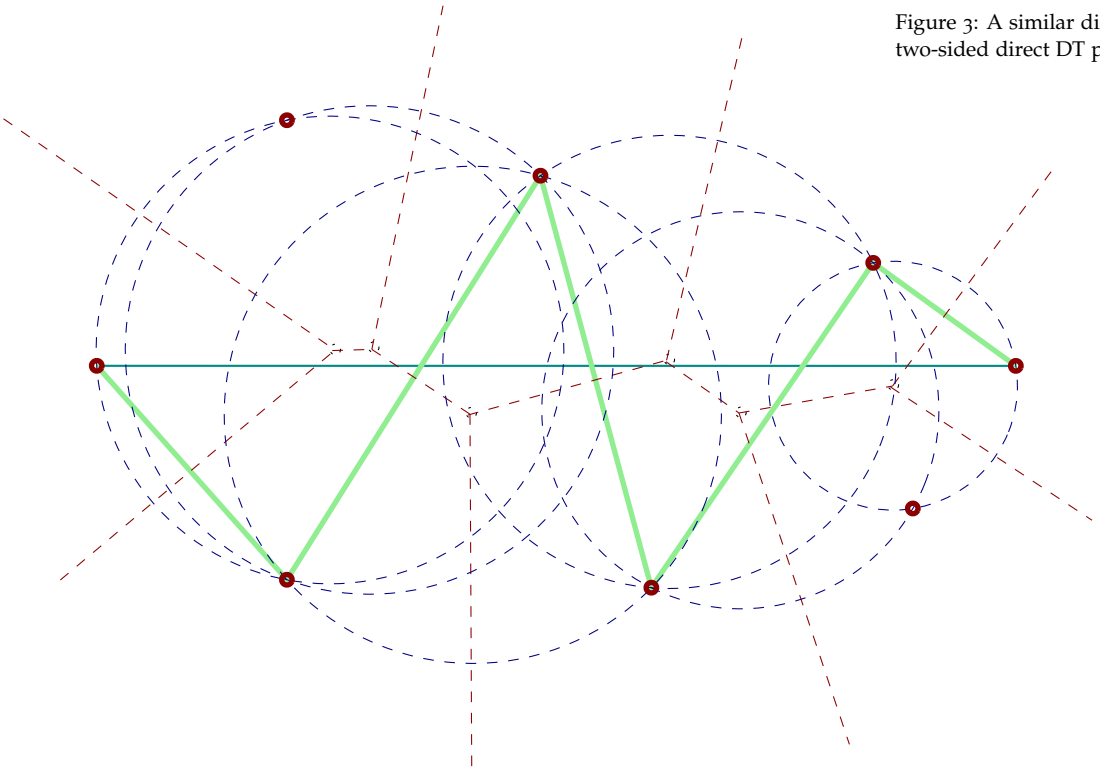

Figure 3: A similar diagram with a two-sided direct DT path.

Keil's Results
